

# Clear Paddock Creek Restoration - Restoring the Waters Project

The Restoring the Waters Project has created a sustainable environment in harmony with today's human landscape.

Where once a concrete storm drain tore through a barren setting, now a beautiful living stream meanders through a rich landscape of life.

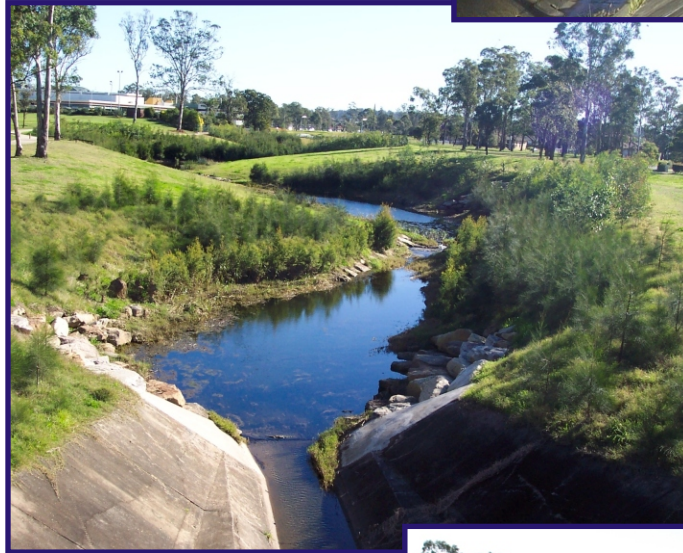

The Project has developed an urban landscape of bio-diversity with clean, clear waters to be enjoyed by all.

The Restoring the Waters project is one of the most innovative projects of its kind and has transformed a concrete channel into a living stream. The Project is an exemplar of total catchment management principles.

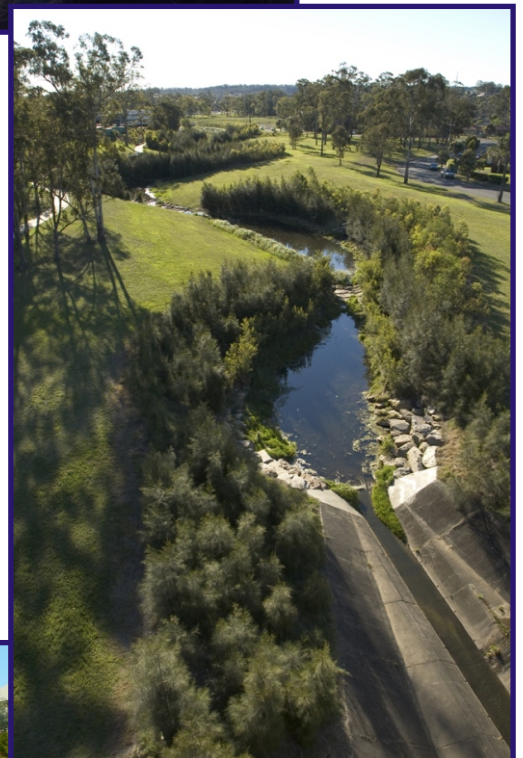

The objectives for Restoring the Waters included, creating aquatic habitat, providing passive recreation, enhancing the aesthetics, improving water quality, promoting bio-diversity, encouraging water reuse and providing educational opportunities for the local community.

The Project did not attempt to return the stream to its original pristine condition but rather focused on creating a system that supports a more sustainable environment in harmony with today's human landscape..

Before - the concrete drain

After - the living stream

A sustainable environment
